
VT100 Mini-Term

BV4141

1. Supplement

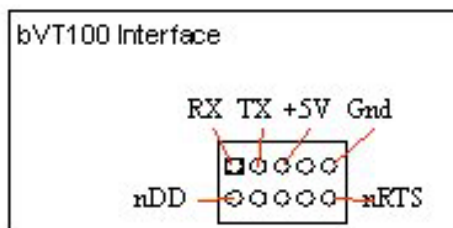

The Display is attached to the PCB with 'peelable' adhesive pads, this is to allow it to be removed or replaced for whatever reason. This can be supplemented with further adhesive if required for a more challenging environment.

The pads are positioned at the bottom of the display as show by the arrows. The adhesive is not very strong and so the display can easily be lifted.

2. PCB Markings

The connector is wrongly marked on the PCB, the datasheet is correct and there should be a small adhesive label on the back of the display with the correct markings

Note that as this is a read only device CTS is not used and so not shown here but it may be shown on the PCB.
